Problem Statement & Real-World Impact

BRIDGING THE GAP BETWEEN THERAPY SESSIONS FOR A STRONGER TOMORROW

Small Movements **Big Possibilities**

1 THE PROBLEM

Home hand exercises prescribed between physiotherapy visits (spaced 1–2 weeks apart)

Zero objective tracking during this gap — no rep count, no movement quality data

Progress relies on subjective patient self-report — unreliable, infrequent

2 TARGET AUDIENCE

Primary:
Stroke / hand-injury / post-surgical patients doing home exercises

Secondary:
Physiotherapists & occupational therapists prescribing the program

Institutional:
Outpatient clinics, home-care & tele-rehab, community health programs

3 CURRENT GAPS & IMPACT

40–70%
of stroke survivors globally have access to rehab services

63%+
of people needing rehab care do not receive it

No visibility into adherence, rep count, or movement quality between visits

Delays therapy adjustments — undermines the repetitive practice recovery depends on
