RehabGrip®

THE QUANTIFIED MOVEMENT PLATFORM

1 **KINEMATICS**
5 FLEX CHANNELS — ROM TO ±2°

2 **EMG**
MUSCLE ACTIVATION — BIOAMP SIGNAL CHAIN

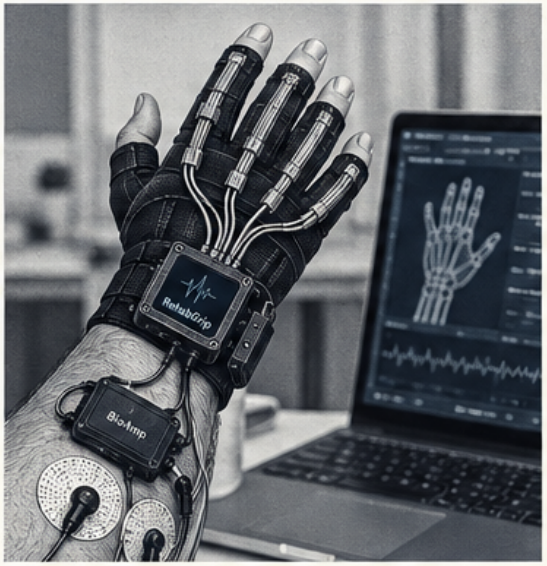

3 **IMU**
WRIST MOTION — COMPENSATION DETECTION

Because Progress Should Be Measurable.

RehabGrip represents a new generation of hand rehabilitation technology — combining precision kinematic measurement, surface electromyography, and inertial motion sensing in a single wearable platform for clinical and research applications.

Five independently calibrated flex sensors deliver per-finger range-of-motion data at 50 samples per second. Synchronized with a surface EMG channel and a 6-axis wrist IMU, the system enables objective movement assessment that was previously available only in laboratory settings.

A cloud-connected clinical dashboard provides real-time 3D visualization, session history, longitudinal trend analysis, and AI-assisted movement pattern assessment — giving clinicians the quantitative data needed to optimize rehabilitation protocols.

Objective. Quantitative. Clinically Relevant.

63%
of patients needing hand rehab receive inadequate monitoring.

50 Hz
continuous multi-channel kinematic sampling rate.

10×
more data per session vs. manual clinical assessment.
