Because Progress Should Be Measurable.

ADVANCED COMPUTING FOR A HEALTHIER TOMORROW.

A new era in hand rehabilitation — where engineering, medicine and human potential work together.

REHABGRIP:
THE QUANTIFIED MOVEMENT PLATFORM.

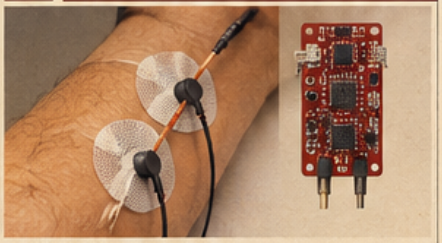

A wearable, multi-sensor system for objective hand rehabilitation and movement assessment. RehabGrip integrates finger kinematics, muscle activity and wrist motion to deliver real-time insights for clinicians, researchers and patients.

1 KINEMATICS

5 x 2.2-inch flex sensors (voltage divider) for digital finger tracking. Measure range of motion, velocity and movement patterns in real time.

2 ELECTROMYOGRAPHY

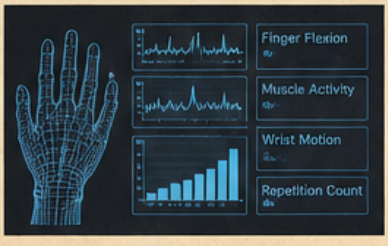

Surface EMG electrodes track muscle activation timing, intensity and coordination. Enable effort analysis and detection of compensatory strategies.

3 COMPENSATION

Integrated 6-axis wrist IMU detects wrist orientation, motion and unintended compensations during exercises for more accurate assessment.

- Multimodal sensing: Flex • EMG • IMU
- Real-time visual feedback
- Objective, data-driven assessment
- Lightweight and wearable design
- For stroke, Parkinson's and hand rehabilitation
- Built for clinics, research and home use

REHABGRIP®

ENGINEERING TODAY FOR A MORE INDEPENDENT TOMORROW.
